*Monday, Mar 27<sup>th</sup> at 11:00 am Salle Marcel Dorée*

# How stochasticity can bestow higher scale robustness in embryogenesis

**Dimitri FABRÈGES, Asst. Prof. Kyoto University**

Group Prof. Hiiragi, Institute for the Advanced Study of Human Biology (WPI-ASHBi) and Department of Developmental Biology of the Graduate School of Medicine, Kyoto University, Kyoto, Japan

*Titulaire d'un PhD en Biologie du Développement (2016) obtenu dans le laboratoire Nadine Peyrières (BioEmergences), Dimitri Fabrèges rejoint l'équipe de Takashi Hiiragi à l'EMBL à Heidelberg, Allemagne. Il suivra le laboratoire jusqu'à l'Institut Hubrecht aux Pays-Bas, où il préparera la mise en place d'une plateforme d'analyse quantitative d'images et de données de recherches. En 2025, il rejoint le département de Biologie de Développement de l'Université de Kyoto en tant qu'Assistant Professor.*

His research focuses on understanding the impact of variability between and within embryos during early morphogenesis, and how embryos integrate stochastic processes into deterministic behaviors at a larger scale. Specifically, Dimitri aims to develop a predictive model of mouse pre-implantation embryogenesis by quantifying cell shape, connectivity, dynamics, and gene expression, combined with experimental perturbations. These questions have led him to work in an interdisciplinary environment that integrates experimental characterization, theoretical analysis, simulations, predictions, and experimental validation. Ultimately, the overarching question is to understand how intrinsically stochastic systems exhibiting great variations can generate a robust and predictable outcome.

In parallel, he is establishing a Research Data Analysis and Quantification facility at the Hubrecht Institute, to support research groups and promote quantitative analysis and theoretical approaches in experimental biology.
